03250-UPL

AMENDMENTS TO THE ABSTRACT:

A carbon nano-tube field emission display has a plurality of strip shaped [[gate]] gates, wherein the strip shaped gate of the triode structure is [[now]] in place of the conventional hole shaped gate, and moreover, pluralities a plurality of cathode electrons are induced by the electric force from the side of the gate. Therefore, when the carbon nano-tube electron emission source emits electrons, which [[is]] are controlled under the strip shaped gate, [[and]] the diffusion direction of the electron beam is confined in the same direction. Consequently, controlling the image pixel and using the particular advantage of the triode-structure field emission display significantly improve the image uniformity and the luminous efficiency.
